

Phạm Khánh Minh Mẫn

Backend Engineer · E-commerce API Integration · LLM-Agent Memory Research

Da Nang, Vietnam · phamkhanhminhman97@gmail.com · github.com/phamkhanhminhman97 · linkedin.com/in/pkmm97 · phamkhanhminhman.com

SUMMARY

Backend engineer with 5+ years in e-commerce, payments and multi-marketplace API integration, mostly in NestJS and TypeScript with event-driven work on AWS. Author of four open-source client libraries for the Shopee, TikTok Shop and Lazada Open APIs, published on npm.

Since 2026, a graduate student in Computer Science (research track) at Danang University of Science and Technology, interested in memory for LLM agents.

EXPERIENCE

DiproTech · Backend Developer

07/2025 - present

Backend for Japanese clients, often several projects at once. Client names withheld under contract.

Publishing platform: subscriptions

08/2026 - present

Rails billing on Stripe and PayPal side by side, plus passkey sign-in in the shared Cognito auth library.

- Wrote the upgrade calculator (several Single plans -> All-in-one, prorated) as plain Ruby, testable without a database or gateway. Checking it against the client's 28 spec cases found 14 miscalculated in the spec itself.
- Gateways redeliver webhooks, so each upgrade or plan switch is claimed by one conditional UPDATE and applied exactly once.
- Receipt PDFs in Japanese and English, stored by receipt number; the row and the upload share a transaction, so a failed upload retries without leaving an orphan.

Ruby on Rails 8 · PostgreSQL · Stripe · PayPal · Sidekiq · RSpec · AWS Cognito · Heroku

Virtual factory: scheduling & simulation

08/2025 - present

Django services for production scheduling, a line simulator and OPC-UA equipment links, sharing one models package.

- Schedule generation takes a Redis lock, so two triggers cannot build the same schedule twice.
- Cycle-time aggregation on Celery, bulk lot approval in one atomic transaction, and a GraphQL client that keeps lot and schedule deletions in sync with an external production system.
- Carried the Container -> Carrier schema change through the shared models wheel, and added quantity-based batch equipment to the simulator and the Java OPC-UA client.

Python · Django · Celery · Redis · PostgreSQL · Java · OPC-UA · GraphQL

Social App

12/2025 - 05/2026

Newsfeed and content distribution, team of 10. Backend started from an empty repo.

- Shuffled feed ordered by a hash of a per-user hourly seed and the post id: cursor pagination stays stable without storing any order.
- Deploy path: dev and staging on Docker Compose, production on ECS with a task definition per service, so one service ships without touching the others. Buildx layer cache, images tagged by commit SHA.

NestJS · TypeScript · PostgreSQL · Redis · AWS ECS / ECR / S3 · GitHub Actions · Docker Buildx

Aptitude-test study app

07/2025 - 10/2025

- Moved the backend from PostgreSQL to Firestore; question bank, topic progress, phone-OTP sign-in.
- Exams draw so every topic is represented; progress stats update incrementally instead of recomputing the category, with Redis caching stats and exam history.

Python · FastAPI · Firestore · Firebase Auth · Redis · Cloud Build

Devtify Technologies · Backend Developer

04/2022 - 06/2025

PaymentShield

01/2025 - 06/2025

Auto loan service between lenders, dealers and customers, team of 7.

- Started the codebase: NestJS, Docker, PostgreSQL, layered by responsibility.
- Webhooks publish to SQS and Lambda consumes them, so a slow downstream cannot block the callback.
- Failed jobs retry with backoff and land in a DLQ instead of disappearing.

NestJS · TypeScript · PostgreSQL · AWS Lambda · AWS SQS · BullMQ · Redis

ROUTINE

01/2024 - 03/2025

Orders, inventory and refunds unified across Shopee, Lazada and TikTok Shop, team of 10.

- One order model over three marketplaces, each with its own API shape and failure modes.
- Kept stock and finance in step with the NaviWorld ERP.
- Integrated three payment gateways and three shipping providers.

NestJS · TypeScript · PostgreSQL · Redis · Elasticsearch · BullMQ · Shopee API · TikTok Shop API · Lazada API

BEAUTYBOX / THEFACESHOP / REEBOK

04/2022 - 11/2023

Retail digital transformation for HSVGroup, team of 15.

- Designed the database and REST API.

NestJS · TypeScript · PostgreSQL · Redis · AWS EC2 · Docker

Vietnam People's Army · Military Service

01/2020 - 01/2022

Completed compulsory military service.

SunWorld B2B Ticket

Ticket selection, online payment and e-ticket storage, team of 7.

- Designed and built the REST API on PHP / Laravel / SQL Server.

PHP · Laravel · SQL Server

SELECTED SYSTEMS**BattleCatsLab** battlecatslab.fun

Personal project · public

Data and simulation site for a mobile game - 9,000 generated pages, a deterministic battle engine, and server-authoritative realtime PvP.

- Server owns the sim and ticks it at 30 Hz; clients send deploy intents and render snapshots, so a client cannot fake a result.
- Ranked ELO gate treats same-IP as telemetry only - shared Wi-Fi must not invalidate a real match; the abuse lockout derives from an append-only log, not a mutable counter.
- A golden-vector test pins fixed team pairs to their exact winner and frame count, so an engine change that would desync stored replays fails CI instead of corrupting them silently.

TypeScript · React · Vite · SQLite · Cloudflare Workers · Cloudflare R2 · SSE

OPEN-SOURCE PACKAGES

Shopee API Client (npm: shopee-api-client) - TypeScript client for Shopee Open API v2. Covers seller authorization, token management, orders, products, logistics, and payment escrow.

TikTok Shop API Client (npm: tiktokshops-api-client) - TypeScript API client for TikTok Shop Open API. Covers seller authorization, order APIs, product APIs, and fulfillment APIs.

Lazada API Client (npm: lazada-api-client) - TypeScript API client for Lazada Open API. Covers seller authorization, order APIs, and product APIs.

All-in-One Package (npm: shopee-tiktokshops-lazada-api) - Bundles the Shopee, TikTok Shop and Lazada SDKs into a single dependency, with versions kept in sync automatically.

SKILLS

Programming languages	TypeScript, JavaScript, Python, PHP, Ruby
Backend Frameworks	NestJS, Express, Laravel, Ruby on Rails, Django, FastAPI
Databases & Search	PostgreSQL, Redis, Elasticsearch, SQL Server, Firestore
Queues & Background Jobs	BullMQ, AWS SQS + DLQ, Sidekiq
Cloud & DevOps	AWS EC2 / S3 / ECS / ECR / Lambda / Cognito, Cloudflare Workers / R2 / D1, Docker, GitHub Actions, GitLab CI, Linux
Testing	RSpec, Vitest, pytest, Golden-vector regression tests
Payment Integrations	Stripe (Checkout, Subscriptions, Webhooks), PayPal Subscriptions, Fundiin, Payoo, ZaloPay, Recurring billing & proration, Webhook idempotency, Invoicing & consumption tax (適格請求書)
E-commerce Marketplaces	Shopee Open API v2, TikTok Shop API v2, Lazada Open Platform
Shipping & ERP	GHN, Ahamove, TikiNOW, NaviWorld ERP
Frontend	React, Next.js, Nuxt

EDUCATION**M.Sc. in Computer Science**

2026 - present

Danang University of Science and Technology (DUT) - The University of Danang

Research track. Coursework in progress; thesis topic not yet decided.

B.Sc. in Information Technology

2015 - 2019

University of Science and Education - The University of Danang

Major in Information Technology.

RESEARCH**When Does Graph Memory Help Beyond Verbalized Relations? Isolating Representation from Structure in LLM-Agent Memory**

2026 - present | Exploratory - no published results | Independent research - not committed as a thesis topic

Question. Graph memory is widely believed to help LLM agents remember better. But when graph memory is compared against flat memory, existing work changes TWO things at once: structure (the ability to traverse relations) and representation (information rewritten as typed relational sentences - unavoidable, because an LLM can only read text). So which of the two does the observed benefit belong to?

Method. Verbalize-control: three token-budget-matched conditions drawing from the same candidate edge pool and differing only in the selector - graph traversal, cosine truncated to the budget, and dump-everything. Plus a degree-preserving shuffled-edge control to separate “these particular edges” from “merely having a graph”. The design is pre-registered, evaluated on an external non-circular benchmark, and specifies the negative branch in advance (TOST equivalence testing).

Status, stated plainly: this is something I work on outside of client work, not a committed thesis topic. A 30-question feasibility probe has been run; the quality gate fired and returned “inconclusive” rather than a result. No publishable numbers.
